

### Assignment 5: Stimulus Discrimination

Graph(s):

#### Short-answer question:

On which day did your rat seem to adjust its behavior? In other words, when did it respond according to the required stimulus discrimination? Explain

My rat seemed to adjust its behavior on Day 3, represented by the only line which has a duration that reaches the full 30-minutes set for this experiment. My rat quit early on both Day 2 and Day 3 (we did not have any Day 1 data). Furthermore, on Day 3 my rat really seemed to distinguish/respond really well according to the required stimulus discrimination: the only lever presses were during S+ periods where light was present (0-5 mins, 10-15 mins, and 20-25 mins). Day 4, there seemed to be a regression, as again he quit responding way before the 30-minute session ended, but also he clicked the lever around the 7-minute mark when the lights were off (which is not in accordance with the required stimulus discrimination).
